

Executive Summary

Omni's vision is to become a "super-app" productivity hub by unifying **Tasks, Notes, Expenses,** and **Calendar** into one intelligent platform. To achieve this, we recommend 30+ enhancements across features, UX, AI, privacy, performance, and beyond. Key suggestions include AI-powered helpers (smart scheduling, meeting summaries), richer collaboration (shared tasks/notes, templates), advanced integrations (email, finance APIs), and robust offline/ sync capabilities. We propose a phased roadmap: an **MVP** with core features (better task handling, basic AI, cross-device sync, offline mode), followed by short-term additions (habit tracking, analytics, voice input), mid-term enhancements (deep AI agents, third-party APIs, advanced security), and long-term innovations (autonomous workflows, AR/VR interfaces). A detailed feature matrix compares Omni to top competitors (Todoist, TickTick, Evernote, Notion, ClickUp) using official sources. Finally, we provide a complete AI developer prompt (with acceptance criteria, API contracts, schemas, tests) to implement the feature set. This report blends best practices from leading productivity apps ¹ ² and user feedback to deliver a comprehensive product plan.

Feature Suggestions

- **Advanced Task Management** – *Enhance Tasks with NLP, hierarchies, and reminders.* Allow adding tasks via natural language (e.g. "Submit report every Friday at 4pm"), auto-parsing dates and tags ³. Support recurring tasks, subtasks/sections, priorities and labels like Todoist ⁴. Add time estimates and start/end times for scheduling (addressing a common Todoist request ⁵). *User value:* Faster task entry, clear prioritisation and habit formation. *Implementation:* Use a client SDK or open-source NLP library (e.g. Duckling) to parse input. Data model: Tasks table with fields (title, due, start, repeat, priority, tags, subtasks). Store in local/mobile DB (SQLite/Realm) with sync to cloud. For offline, use a queue to save updates. *Effort:* Medium; NLP parsing libraries are mature. *Priority:* **Must** (core feature). *Risks:* Date ambiguity or incorrect parsing – mitigate with validation UI. User may add sensitive notes to tasks – encrypt task data at rest. *Example flow:* User says "**Remind me to pay rent on the 1st**" → system parses "pay rent" with due date monthly on 1st → creates recurring task with reminder.
- **Shared Projects and Collaboration** – *Enable multi-user collaboration on tasks and notes.* Allow creating shared task lists and assigning tasks to specific users ⁶. Each project can be shared (private or public) with role-based permissions (view/edit) like Todoist and ClickUp ⁷ ⁸. Add comments and file attachments on tasks for discussion. *User value:* Teams and families can jointly manage to-dos in Omni. *Implementation:* Build a simple permissions model (workspace/ team, roles). Sync tasks to users via backend (WebSockets or push). Tech: Real-time database (e.g. Firebase, or a custom WebSocket server). *Effort:* High (real-time collaboration can be complex). *Priority:* **Should** (important for multi-user). *Risks:* Data leakage if sharing is misconfigured – implement secure sharing links and previews. Ensure TLS encryption in transit and role checks server-side. *Example UI:* In a task view, a "Share" button opens a dialog to invite team members or generate a public link with access controls (similar to Todoist project sharing ⁹).
- **Integrated Calendar and Scheduling** – *Tighten Calendar integration and views.* Support multiple calendar accounts (Google, iCal, Outlook) so all events appear in Omni ¹⁰. Allow dragging tasks

onto calendar slots to schedule them. Provide list, **Calendar**, and Kanban views for task lists ¹¹. Display deadlines and events together (as in Notion Calendar's unified view ¹²). Add features like conflict detection and time-zone support (Notion Calendar style ¹³). *User value*: Single-pane scheduling; avoid double-booking; clearer time planning. *Implementation*: Use platform APIs (Google Calendar API, Microsoft Graph) for sync. Store events in calendar DB. For UI, integrate a calendar widget library. *Effort*: High (multi-account auth, sync logic). *Priority*: **Must** (core for productivity). *Risks*: OAuth security – follow best practices (token encryption, minimal scopes). Inform users what calendars are accessed. *Example flow*: User links Google Calendar and Outlook. Omni's Calendar view shows all events. Dragging a task item into a date automatically creates an event with task details.

- **Expense Tracker Enhancements** – *Make expense tracking smarter and seamless*. Support receipt OCR (image scanning) to auto-fill expense entries (leveraging ML libraries) and categorize by merchant/domain. Allow linking receipts/photos to expense records. Add budget alerts and periodic expense reports (charts/graphs). Handle multiple wallets/currencies. *User value*: Quicker expense entry, automatic categorisation, visual budgets. *Implementation*: OCR/ML via on-device or cloud service (e.g. Tesseract or Google ML Kit). Data model: Expenses table (amount, category, merchant, photo URL). For analytics, aggregate expenses. *Effort*: High (OCR integration). *Priority*: **Should** (adds polish, not core). *Risks*: Privacy: sensitive financial data – store in encrypted database and opt-in cloud sync. Ask user permission to access camera/photos. *Example flow*: User snaps a photo of a receipt. Omni extracts “Cafe Latte \$4.50” and suggests category “Food”. User confirms and expense is logged with photo thumbnail.
- **Habit & Goal Tracking** – *Add habit-tracker and goal-setting*. Let users define recurring habits (e.g. “Drink water daily”) and track streaks, similar to TickTick's Habit feature ¹⁴. Integrate with tasks (habit tasks repeat daily). Provide visual charts of progress. *User value*: Encourages self-improvement and routine building. *Implementation*: Simple habits DB, recurring task templates. Use data visualization library for charts. *Effort*: Low. *Priority*: **Could** (nice-to-have for engagement). *Risks*: Overkill for some users – make optional feature toggle. No sensitive risk here. *Example UI*: In profile or dashboard, a “Habits” tab with toggle switches and completion stats (e.g. “7-day streak!”).
- **Advanced Notes Features** – *Upgrade the Notes module*. Support rich text (formatting, checklists, tables) and markdown. Allow linking between notes and tasks (bi-directional links). Include web clipping and camera scanning (like Evernote Web Clipper ¹⁵). Add real-time collaboration on notes (shared editing) and comments. *User value*: Turns Omni Notes into a complete second brain (like Evernote ¹⁶). *Implementation*: Use a rich-text editor component (Slate.js or Quill). For linking, implement a wiki-like linking syntax. For clipper, offer browser extension or share-sheet. *Effort*: High. *Priority*: **Should** (notes are core). *Risks*: Data sync conflicts – use operational transforms or CRDT for multi-user editing. Ensure media attachments are virus-scanned. *Example flow*: User clips a web article via browser. Omni creates a new note with the title, content, and link. In a meeting note, a person links a task by typing “@task1234”, which creates a two-way link.
- **AI Summaries & Assistants** – *Integrate AI/ML features*. Provide AI-powered meeting notes (transcribe and summarise calendar events or voice calls) ¹⁷, and an AI writing assistant for notes and tasks (suggest titles, summaries, rewrite notes). For example, Notion AI's agents can draft reports and triage tickets ¹⁸. *User value*: Saves time on note-taking and brainstorming. *Implementation*: Use a cloud AI service (OpenAI, Anthropic) for NLP. For meeting transcription, use platform speech-to-text then summarise. *Effort*: High (and costly APIs). *Priority*: **Should** (differentiator). *Risks*: Data privacy: user content sent to AI provider – explicitly disclose and allow

opt-in. Mitigate hallucinations by citing sources if possible. *Example flow:* After a Zoom meeting ends, Omni automatically records audio (with permission), transcribes it, and generates action items as new tasks.

- **Intelligent Notifications & Reminders** – *Smart reminders and alerts.* Offer location-based reminders (e.g. “when I arrive at the store” as in Apple Reminders ¹⁹). Provide a “nag” mode (constant reminders) until completion (TickTick’s constant reminder ²⁰). Use push notifications with custom actions (snooze, mark done). *User value:* Reduces missed tasks, increases responsiveness. *Implementation:* Use OS geofencing APIs for location. Schedule local notifications. *Effort:* Medium. *Priority:* **Should**. *Risks:* Privacy: location tracking opt-in and minimal retention. Battery usage – allow users to disable location triggers. *Example:* User sets a reminder “buy milk when near supermarket”. Omni uses phone GPS to trigger when near tagged location.
- **Offline Mode & Sync** – *Full offline-first support.* Ensure all features (tasks, notes, calendars, expenses) work offline and sync seamlessly when online. Use local databases (e.g. SQLite, Realm) and a sync engine (like Couchbase Mobile or custom with a REST API). Handle conflict resolution (e.g. “last write wins” or user prompts). *User value:* Reliability in low-connectivity (airplanes, remote areas) and faster app experience. *Implementation:* Architect as local-first app: all data operations read/write local DB; a background sync service pushes changes via APIs. *Effort:* High. *Priority:* **Must** (basic app quality expectation). *Risks:* Data conflicts; mitigate with timestamps and user review. Require encryption at rest on device (especially for expenses).
- **Cross-Platform UI/UX Consistency** – *Modern, responsive design across devices.* Implement a unified design system (e.g. Google’s Material or Apple’s HIG) with support for dark mode and high-contrast. Provide mobile apps (iOS/Android), web/desktop (React, Electron). Use widgets/shortcuts (iOS widgets, Android home screens) for quick glances. *User value:* Familiar look-and-feel; accessibility. *Implementation:* Use cross-platform frameworks (React Native or Flutter) or native with shared backend. Include accessibility features (VoiceOver, large fonts). *Effort:* Medium. *Priority:* **Must**. *Risks:* Accessibility often overlooked – follow WCAG guidelines. Use user testing to verify usability.
- **Onboarding & Personalization** – *Guided onboarding and user personas.* Provide an initial setup wizard (e.g. import tasks from competitors, link calendars/accounts) and sample templates. Allow personalization like theme/colors and arranging module dashboard. *User value:* Lower learning curve, quicker adoption. *Implementation:* Develop onboarding flows with optional tutorials. Store user preferences in profile settings. *Effort:* Low. *Priority:* **Must** (first impression matters). *Risks:* Too many options can confuse – keep it optional and skippable.
- **Built-in Analytics & Reporting** – *Usage and productivity analytics.* Track user’s completed tasks, time spent, spending patterns, etc., and display dashboards (charts of tasks by project, expenses by category). Include “streaks” or weekly goals (Todoist Karma style ²¹). *User value:* Insights into habits and productivity. *Implementation:* Instrument key events in app; aggregate in backend. Use libraries like Chart.js for graphs. *Effort:* Medium. *Priority:* **Could** (adds value for power users). *Risks:* Privacy: analytics should be anonymised or opt-in. Allow users to export or delete analytics data.
- **Extensibility – Developer APIs & Plugins** – *Public API and webhooks.* Offer a well-documented REST or GraphQL API so third-party developers can query and update Omni data (tasks, notes, events, expenses). Support webhook callbacks on events (e.g. task completed). *User value:* Ecosystem growth and integration flexibility. *Implementation:* Build REST endpoints with

authentication (OAuth2 or API keys). Data models per module (e.g. `/api/tasks`, `/api/notes`). *Effort*: High (requires robust backend). *Priority*: **Could** (for advanced integration). *Risks*: API security – implement rate limiting, auth scopes. Clearly document endpoints (OpenAPI). Provide sandbox for testing. *Example API contract*: `GET /tasks?completed=false` returns JSON list of tasks (schema with id, title, dueDate, etc.) and webhook `POST /webhook/task-completed` with payload `{taskId, userId, timestamp}`.

- **Integrations with Popular Services** – *Connect Omni to other apps*. Integrate with email (create tasks from email, export notes to Gmail/Outlook); messaging (Slack, Teams bots); document storage (Google Drive, OneDrive); project tools (Jira, Trello) via Zapier or native. For Expense, integrate bank APIs (Plaid) to auto-import transactions. *User value*: Centralises workflow; reduces app-switching. *Implementation*: Leverage existing integrations platforms (Zapier, IFTTT) for breadth, and build native connectors for key services (e.g. OAuth to Google Calendar/Drive). *Effort*: High. *Priority*: **Should** (differentiator for a super-app). *Risks*: Many: each API has its own auth and limitations. Mitigation: use official SDKs, refresh tokens. Monitor for breaking changes. *Example flow*: User toggles Gmail integration: Omni uses Gmail API to scan starred emails and create tasks from them nightly.
- **Privacy & Security Enhancements** – *Protect user data*. Implement end-to-end encryption for sensitive data (personal notes, expenses) ²². Offer optional password or biometric lock on app launch. Comply with GDPR/CCPA: allow data export/deletion. Use secure authentication (OAuth2, 2FA), validate all inputs to prevent injection. *User value*: Trust and peace of mind. *Implementation*: Use TLS for all network traffic. Encrypt local DB (SQLCipher). For E2EE notes/expenses, keys only on user device. *Effort*: High. *Priority*: **Must**. *Risks*: Security bugs – conduct regular audits. Publish a clear privacy policy and gain user consent for data use. *References*: Companies like ClickUp highlight SOC2/GDPR compliance ²³, which we should match.
- **Monetization and Premium Features** – *Freemium model with value-add*. Provide basic features for free (up to a reasonable quota). Monetize via subscription or one-time purchase. Premium could unlock advanced analytics, AI assistants, more storage/attachments, or team workspaces. *User value*: Flexibility and continued development funding. *Implementation*: Integrate in-app purchases (App Store/Play Billing) and handle account entitlements on backend. *Effort*: Medium. *Priority*: **Must** (business viability). *Risks*: Avoid paywalls on essential features (tasks, sync). Comply with App Store guidelines.
- **Performance & Scalability** – *Optimize responsiveness*. Lazy-load data on scroll, compress images, use background syncing. Profile the app to fix bottlenecks. *User value*: Smooth user experience. *Implementation*: Use efficient queries, limit payloads, use CDNs for assets. *Effort*: Medium. *Priority*: **Must**. *Risks*: Caching stale data – invalidate properly.
- **Accessibility Improvements** – *Make Omni usable by all*. Support screen readers, voice commands, high-contrast themes, large-font mode. *User value*: Inclusive design broadens user base. *Implementation*: Follow WCAG; test with VoiceOver/TalkBack. *Effort*: Medium. *Priority*: **Should**. *Risks*: UI clutter – ensure alt-text on images, focus management.
- **On-Demand Smart Search** – *Unified search across Omni*. Let users search tasks, notes, expenses, and calendar events from one bar. Include filters (by date, tag, content). Offer NLP search (e.g. “show tasks due next week”). *User value*: Quickly find anything. *Implementation*: Build a search index (like Elastic or Firebase). Sync searchable text to index. *Effort*: Medium. *Priority*: **Must** (improves usability). *Risks*: Leaking private data via search – keep index encrypted or secure.

- **User Feedback Loop** – *In-app feedback and feature voting*. Include a feedback form or “ideas board” where users can report bugs or suggest features (anonymously or by login). *User value*: Empowers users, drives product relevance. *Implementation*: Host a simple webform or integrate a third-party service (Canny, UserVoice) and track within Omni. *Effort*: Low. *Priority*: **Could**. *Risks*: Abuse – moderate or limit submissions.
- **Customizable Dashboards** – *Role-based home screens*. Let users pin modules/widgets (calendar widget, expense summary, task list). For example, a finance manager might emphasize expense charts. *User value*: Personal efficiency. *Implementation*: Develop a widget framework in the app (grid layout). *Effort*: Medium. *Priority*: **Should**. *Risks*: Complexity – start with a few fixed layouts.
- **Cross-Device Continuity** – *Seamless transitions*. E.g., if a user adds a task on their phone, it should appear instantly on web/desktop (real-time sync). If the user is on laptop, a mobile push can notify them of an upcoming task. *User value*: Frictionless multi-device use. *Implementation*: Use WebSockets or push notifications for realtime. *Effort*: High. *Priority*: **Should**. *Risks*: Data conflicts – handle merges gracefully.
- **Offline First for Web** – *PWA capabilities*. Enable Omni to be installed as a Progressive Web App with caching (tasks and notes offline on web). *User value*: Access via browser even without internet. *Implementation*: Use Service Workers for caching assets and IndexedDB for data. *Effort*: Medium. *Priority*: **Could** (future). *Risks*: Complexity with sync; clearly show offline status.
- **Automated Backup & Import/Export** – *Data portability*. Allow users to export their data (JSON/CSV for tasks and expenses) and import from common formats (CSV from Excel, iCal/CSV tasks). Include scheduled backups to cloud (e.g., weekly to user’s Google Drive). *User value*: Data control and safety. *Implementation*: Provide export functions. For cloud backup, integrate Google Drive/Dropbox APIs. *Effort*: Medium. *Priority*: **Should** (prevent data loss complaints). *Risks*: Privacy of exported data – encrypt backups or warn user.
- **Universal Inbox** – *Aggregate tasks and notifications*. Similar to Routine’s “Universal Inbox” ²⁴, collect notifications (due tasks, mentions, calendar invites) in one feed. *User value*: Don’t miss important updates. *Implementation*: Create a notification center in the app; centralize push/cue of events. *Effort*: Medium. *Priority*: **Could**. *Risks*: Notification spam – allow filtering by type.
- **Task & Expense Automation Rules** – *IFTTT-style automation*. Let users set rules (e.g. “If I mark a task complete, send email” or “If expense > \$100, ask me to tag category”). *User value*: Saves repetitive steps. *Implementation*: Build a simple rule engine or integrate an automation service (Zapier). *Effort*: High. *Priority*: **Could**. *Risks*: Complexity for users – implement safe defaults.
- **Voice & Chat Interfaces** – *Voice assistant and chatbots*. Integrate with smart speakers (Alexa/Google) or provide a chat interface within the app to query tasks/notes (“What do I have today?”) or enter data via voice. *User value*: Hands-free convenience. *Implementation*: For voice, use platform SDKs (Android Assistant, Siri Shortcuts). For chat, build a simple chatbot UI connected to Omni’s data or GPT. *Effort*: High. *Priority*: **Could**. *Risks*: Misrecognition – always allow manual correction.
- **Contextual Smart Actions** – *Predictive widgets*. On mobile homescreen or lock screen, suggest actions (e.g. “View today’s tasks”) based on time or location. *User value*: Reduces friction. *Implementation*: Use iOS shortcuts suggestions or Android App Actions. *Effort*: Low. *Priority*: **Could**. *Risks*: Distraction – make opt-in.

- **Integrated Timer & Stopwatch** – *Time tracking*. Add a built-in timer/Pomodoro (TickTick style) to track work on tasks ²⁵. Optionally, integrate with expense as billable hours. *User value*: Helps with focus and billing. *Implementation*: Simple timer component. *Effort*: Low. *Priority*: **Should**. *Risks*: None significant (maybe CPU use).
- **Cross-Platform Sync (Cloud Backend)** – *Robust syncing*. Use a scalable backend (e.g. AWS/Firebase) with conflict resolution. Provide browser extensions and wearable support (smartwatch reminders). *User value*: Anywhere access. *Implementation*: Choose a database that supports conflict resolution (CouchDB) or custom API with last-write-wins. *Effort*: High. *Priority*: **Must**. *Risks*: Data loss – implement versioning.
- **Template Library** – *Pre-built workflows*. Offer templates for common use-cases (meeting agendas, budgeting, project plans). *User value*: Jumpstart setup. *Implementation*: Create template JSON and allow import. *Effort*: Low. *Priority*: **Could**. *Risks*: Overwhelm – categorize templates.
- **Activity Logging & Undo** – *Action history*. Keep a log of actions and an undo/redo feature (critical for edits). *User value*: Recover from mistakes. *Implementation*: Store change history in DB. *Effort*: Medium. *Priority*: **Should**. *Risks*: Data bloat – limit log depth.
- **Dark Mode & Themes** – *Custom theming*. Provide dark/light themes and accent colours. *User value*: Comfort and branding. *Implementation*: Use theming support in UI framework. *Effort*: Low. *Priority*: **Must**. *Risks*: Maintain accessibility (contrast).
- **Multi-language Support** – *Internationalisation*. Translate the UI into top languages; allow locale formatting. *User value*: Wider adoption. *Implementation*: Use i18n frameworks. *Effort*: Low-medium. *Priority*: **Should**. *Risks*: Hard-coded text – plan translation from start.
- **Board & Kanban Views** – *Visual task management*. Add a Board (Kanban) view of tasks (like Trello/ClickUp) for those who prefer drag-and-drop columns. *User value*: Visual organisation. *Implementation*: Use a kanban component library. *Effort*: Medium. *Priority*: **Could**. *Risks*: Performance – virtualize if many tasks.
- **Subtasks and Hierarchies** – *Nested tasks/projects*. Allow tasks to have sub-items (as Todoist/ClickUp do) ⁴, with collapsible hierarchy. *User value*: Organise complex tasks. *Implementation*: Recursive task model in DB. *Effort*: Medium. *Priority*: **Must**. *Risks*: UI complexity – design clear indent/outdent controls.
- **In-App Tutorials and Help** – *Guided tours and tooltips*. Provide quick hints on first use of each module. *User value*: Users learn features faster. *Implementation*: Use a library (e.g. Shepherd.js) for step-by-step hints. *Effort*: Low. *Priority*: **Should**. *Risks*: Outdated tips – update with releases.
- **Bulk Operations** – *Mass edit/delete*. Let power users select multiple tasks/expenses to change tags, dates or delete in one action. *User value*: Saves time on cleanup. *Implementation*: Multi-select UI and batch API endpoints. *Effort*: Medium. *Priority*: **Should**. *Risks*: Accidental changes – confirm or allow undo.
- **Advanced Search Filters** – *Smart filters*. Support search queries like “tasks due this week with tag ‘urgent’” or filter by custom fields (e.g. project, expense category). *User value*: Quickly find what’s needed. *Implementation*: Enhance search index with metadata. *Effort*: Medium. *Priority*: **Must**. *Risks*: None major.

- **Contextual Menus & Quick Actions** – *Right-click or long-press menus*. Provide quick action menus on tasks/notes (e.g. mark done, set reminder, duplicate, share). *User value*: Efficiency for power users. *Implementation*: UI feature; use platform context menus. *Effort*: Low. *Priority*: **Should**. *Risks*: UI clutter – only core actions.
- **Embedded Web Views and Widgets** – *Integration widgets*. E.g., embed charts from Excel or Google Sheets, or show a mini weather widget next to calendar. *User value*: Keeps Omni in one place. *Implementation*: Allow iframe/embed elements in notes/dashboards. *Effort*: Medium. *Priority*: **Could**. *Risks*: Security – sanitize embeds (CSP).
- **Data Analytics for Admins** – *Admin dashboard (for teams)*. If Omni has team plans, include admin views: user counts, average tasks completed, security alerts, etc. *User value*: Organizational oversight. *Implementation*: Additional role and UI with aggregated metrics. *Effort*: Medium. *Priority*: **Could** (enterprise). *Risks*: Data privacy – only show aggregated stats.
- **Third-Party App SDKs** – *Mobile SDK or embed widget*. Let developers embed Omni's task list or calendar in their own apps. *User value*: Omni becomes platform. *Implementation*: Provide an embeddable JavaScript widget or mobile SDK with limited API. *Effort*: High. *Priority*: **Could**. *Risks*: Security – restrict cross-origin.
- **Continuous Performance Monitoring** – *In-app performance logs*. Track app load times and errors remotely to catch regressions. *User value*: Ensures app remains fast. *Implementation*: Integrate analytics (Firebase Crashlytics). *Effort*: Low. *Priority*: **Should**. *Risks*: Privacy – anonymize logs.
- **One-Tap Task Capture** – *Widgets/Shortcuts for quick entry*. E.g., a home-screen widget or smart watch complication to add tasks/expenses without opening the app. *User value*: Convenience for on-the-go. *Implementation*: Use Android App Widgets, iOS WidgetKit, or Siri Shortcuts. *Effort*: Medium. *Priority*: **Should**. *Risks*: UX – keep input minimal.

Prioritized Roadmap

Feature / Milestone	Timeframe & Resources	Priority (M/S/C)
MVP (0–3 months) : Core syncing and multi-platform foundation; Task CRUD with NLP parsing; Basic Calendar view; Offline data storage; Secure auth (OAuth2, encryption); Dark mode; Onboarding wizard. <i>Effort</i> : Small dev team (2–3 devs) continuous integration.		Must : Core functionality and stability.
Short-term (4–6 months) : Shared projects & collaboration; Recurring tasks; Reminders (time/location); Advanced search; Theme customization; Import/Export; Basic templates. <i>Effort</i> : Add 1–2 frontend, 1 backend; UX designer for UI polish.		Should : Teamwork and scheduling features.

Feature / Milestone	Timeframe & Resources	Priority (M/S/C)
Mid-term (7–12 months): AI features (meeting notes, writing assistant); Habit tracker & Pomodoro; Expense OCR and categorization; Integration plugins (e.g. Slack, Google Calendar, email); Analytics dashboards; Web/PWA support; Accessibility enhancements. <i>Effort:</i> +Data engineer or ML specialist; continuous UI improvements.	Should: Differentiation and analytics.	
Long-term (1–2 years): Third-party APIs & webhooks; Advanced security (E2EE); Automation rules/agents; Voice/chatbot interfaces; Developer SDKs; Offline-first web app; Expanded enterprise admin features. <i>Effort:</i> Add DevOps (security), dedicated API team.	Could: Innovation and ecosystem growth.	

Timeline is approximate. MVP aims for a stable release by Q4 2026 (6 months from May), with foundational architecture. Short- and mid-term rollouts prioritize collaboration, AI, and mobile/web parity. Long-term features (AI agents, E2EE, platform APIs) would require significant R&D. Resource assumptions: a core full-stack team (3–5 developers, 1 designer) scaling up as needed, with parallel workstreams on mobile/web and backend.

Competitor Feature Matrix

Feature / Module	Todoist ³ ⁶	TickTick ²⁶	Evernote ²⁷ ²⁸	Notion ¹² ²⁹	ClickUp ³⁰ ³¹
Tasks & Reminders	Yes: recurring tasks, subtasks, priorities; natural-language input ³ ; reminders by time/ location	Yes: multi reminders, calendar views, recurring tasks ²⁶	Yes (in notes): integrated task lists with reminders (basic) ²⁷	Yes: tasks via databases; calendar view; reminders (with integrations) ¹²	Yes: full task mgmt with templates, assignees, dependencies ³²
Notes / Docs	Limited: one-line comments on tasks	Minimal: task descriptions	Full: Rich notes, attachments, notebooks ³³	Full: Rich text, databases, wiki-style linking (AI tools)	Full: Docs, wikis, chat, whiteboards ³²
Calendar Integration	Built-in list/ board/ calendar views ³⁴	Yes: built-in multi-view calendar ³⁵	Basic: Google Calendar sync via add-on (Task app)	Full: Notion Calendar (syncs Google/ iCloud) ¹² ²⁹	Yes: built-in calendar view, integrates Outlook/GCal ³⁶
Expense Tracking	None	None	None	None	None
AI Features	Limited (NLP parsing)	Limited (date parsing)	Yes: OCR scanning ³³ , AI Meeting Notes	Yes: Notion AI Agents, Meeting Notes ¹⁸	Yes: ClickUp Brain AI assistant ³¹
Offline Support	Yes (iOS/ Android apps work offline)	Yes: offline mobile support	Partial (Evernote caches notes offline)	Partial (Notion has limited offline mode)	Partial (Desktop has offline, web limited)
Cross-Platform Sync	Yes: web, iOS, Android, extensions ³⁷	Yes: web, iOS, Android, watch ³⁸	Yes: web, iOS, Android, Mac, Windows	Yes: web, iOS, Android, Mac, Windows ³⁹	Yes: web, iOS, Android, desktop, watches ⁴⁰

Feature / Module	Todoist ³ ₆	TickTick ²⁶ ₂₈	Evernote ²⁷ ₂₉	Notion ¹² ₄₃	ClickUp ³⁰ ₃₁
Integrations	80+ (Slack, email, cloud apps) ⁴¹	Supports Google Calendar, email, Notion ⁴²	Few (Web Clipper, IFTTT)	Many via Zapier; Slack, GCal, GitHub ⁴³	1,000+ tools (Google, MS, Slack, Jira, etc.) ³⁶
Collaboration	Yes: shared projects, comments, file attach ⁴⁴	Yes: share lists, assign tasks ⁴⁵	Yes: share notebooks, real-time edit ⁴⁶	Yes: real-time co-edit, comments on pages	Yes: workspaces, roles, @mentions, docs ³²
Task Views (List/Board)	Yes (List, Board, Calendar) ⁴⁷	Yes: Kanban & calendar ⁴⁸	No (notes only)	Yes: List, Board, Calendar views for DBs	Yes: List, Board, Gantt, Box, Calendar ⁴⁰
Templates	Yes: Project templates ⁴⁹	No built-in templates	No (use Snippets)	Yes: many templates (community/shared)	Yes: 1,000+ templates (projects, wikis)
Analytics	Yes: activity trends, karma ⁵⁰	Yes: productivity stats ⁵¹	No built-in, only search	No built-in analytics	Yes: Dashboards, reporting, goals
Monetization	Freemium (Pro & Business plans)	Freemium (Premium subscription)	Freemium (Plus, Premium tiers)	Freemium (Personal, Team, Enterprise)	Freemium (Free, Unlimited, Business)
Privacy/ Security	Standard encryption, GDPR compliant	GDPR compliant, TLS	End-to-end encryption (Paid)	Enterprise-grade security (SSO, SCIM)	SOC2, ISO 27001, HIPAA, GDPR compliant ²³

This matrix highlights Omni's unique opportunity: for example, most leaders **lack an expense module**, whereas Omni can differentiate by tightly integrating personal finance tracking with productivity. Omni should match or exceed competitors in core areas (sync, collaboration, multi-platform) while innovating on AI, automation, and privacy (e.g. by offering end-to-end encryption beyond what most productivity apps provide) ²³ ³³ .

Example AI Developer Prompt

You are a developer for Omni, building features across Tasks, Notes, Expense, and Calendar modules. Implement the following user stories with clear acceptance criteria, JSON APIs, and data schemas.

1. Task Creation API: As a user, I can create a new task by sending `POST /api/tasks` with JSON `{ "title": "Submit report", "dueDate": "2026-05-20T17:00Z", "recurrence": "P1W", "tags": ["Work", "Urgent"] }`. The API should return the created task with `id`. Accept ISO 8601 dates.
Acceptance: Status 201 returned; response JSON `{id, title, dueDate, recurrence, tags, createdAt}`. Reject invalid dates (400 error). Persist in database.
Data Schema: Task { id: UUID, title: string, dueDate: datetime, startDate?: datetime, recurrence?: string, priority?: int, tags: [string], attachments?: [URL], ... }.
Test: Call with valid data; expect 201 and correct fields. Call with bad date; expect 400 error.

2. Calendar Integration: Implement `GET /api/calendar/events?from=...&to=...` that returns events from linked external calendars. Use OAuth to fetch from Google Calendar (client provides OAuth token).
Acceptance: Returns list of events `{id, title, start, end, source: "google"}` in date range. If user hasn't linked any calendar, return empty list.
API Contract: `GET /api/calendar/events?from=2026-05-01&to=2026-05-31` → `[{id: "g1", title: "...", start: "2026-05-10T10:00Z", end: "2026-05-10T11:00Z", source: "GoogleCalendar"}]`.
Sample Test: Link a Google account with sample events; query endpoint and verify returned events match Google's.

3. Expense OCR: When user uploads a receipt image via `POST /api/expenses` with multipart form, call OCR to extract amount and merchant. Then create expense.
Acceptance: On upload, parse text (e.g. "TOTAL \$12.50"), fill `amount` and `description`. Store image link. Respond with full expense JSON.
Data Schema: Expense { id: UUID, amount: float, currency: "USD", merchant: string, date: date, category?: string, note?: string, imageURL: string }.
Test: Upload a sample receipt image; verify returned JSON matches expected amount and merchant.

4. AI Meeting Notes: After a meeting (trigger via calendar event ended), automatically call the NLP summarization service. For example, `POST /api/ai/summarize` with transcript text.
Acceptance: Return JSON `{summary: "...", actionItems: ["Task1", "Task2"], questions: ["..."]}`. Ensure content is relevant.
Test: Provide a known transcript input, verify summary contains key points; verify action items array is non-empty.

5. Data Encryption: All endpoints must require an authenticated user token. Sensitive fields (e.g. `notes.content`, `expenses.category`) should be stored encrypted.

Acceptance: Fetching a note by `GET /api/notes/{id}` returns decrypted plaintext for owner, 403 for others. Data at rest in DB is encrypted (verify by inspecting DB storage).

Test: Sign in as user A, create a note with content "Secret", retrieve – must see "Secret".

Inspect DB record (raw) – should not reveal plaintext.

For each endpoint, include appropriate HTTP status codes. Use JSON Schema for request validation (e.g. task schema above). Provide unit tests covering creation, retrieval, and error cases (e.g., missing required fields yields 400). Ensure the above APIs inter-operate: e.g., tasks created via NLP also appear in `GET /api/tasks`. Document all APIs in an OpenAPI (Swagger) spec and include Postman-style example requests in project docs. The acceptance criteria and sample data schemas above guide the development of Omni's core features.

```
flowchart LR
    U[User] -->|Clicks "+ New Task"| App
    App -->|POST /api/tasks| API
    API --> DB[(Database)]
    DB --> API
    API -->|201 Created + Task JSON| App
    App --> U
```

Sources: We gathered the above recommendations from leading app features (e.g. Todoist's natural-language Quick Add ³, TickTick's habit tracker ¹⁴, Evernote's clipping and collaboration ³³, Notion's calendar integration ¹², and ClickUp's all-in-one platform approach ³⁰), as well as mobile design best practices and privacy guidelines ²³ ¹⁹. Each feature aligns with user pain points (from forums and reviews) and technical trends (e.g. AI assistants) to ensure Omni is competitive now and in the future.
